

# JORC Code, 2012 Edition – Table 1 report Segele Diamond Drill program, SW Ethiopia

## Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> <li>• <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></li> <li>• <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></li> <li>• <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></li> <li>• <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Diamond Drill holes were completed using NQ size (47.6 mm diameter core) standard tube drilling. Core loss was encountered frequently at depths less than 30 m, however all the mineralised intersections in the drill holes occurred below this depth. Core recovery from depths greater than 30 m was consistently above 97% with only three drill runs with recoveries &lt;90%. Diamond drill samples were taken over intervals ranging from 0.41 to 1.7 m although most samples were taken over 1 m intervals.</li> <li>• Diamond core drilling has been used to extract NQ diameter core samples, in the relevant intersections the core was split length wise and one half was submitted to an accredited laboratory for gold and multi element assay.</li> <li>• A full QAQC program has been adhered to with Certified reference materials, blanks and duplicates used frequently.</li> <li>• For gold analysis a screen fire assay was used where visible gold has been observed, remaining samples were subjected to 50g fire assay.</li> </ul>
Drilling techniques	<ul style="list-style-type: none"> <li>• <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i></li> </ul>	<ul style="list-style-type: none"> <li>• Diamond drill core with NQ diameter (47.6mm diameter), core was oriented using a Devicore BBT system that marks the base of the hole for each core run.</li> </ul>
Drill sample recovery	<ul style="list-style-type: none"> <li>• <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i></li> <li>• <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></li> <li>• <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i></li> </ul>	<ul style="list-style-type: none"> <li>• All data has been continuously recorded and entered into a managed, cloud-based database (MxDeposit).</li> <li>• Diamond drill recoveries were calculated by measuring the core recovered against the drillers recorded depth for each diamond core run. Core loss was encountered frequently at depths less than 30 m, however all the mineralised intersections in the drill holes occurred at depths greater than 30m. Core recovery from depths greater than 30 m was consistently above 97% with only three drill runs with recoveries &lt;90%.</li> <li>• Core recovery was calculated by measuring the core recovered against the</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>drillers recorded depth for each drill run.</p> <ul style="list-style-type: none"> <li>• There is no apparent correlation between grade and sample mass.</li> </ul>
Logging	<ul style="list-style-type: none"> <li>• <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></li> <li>• <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i></li> <li>• <i>The total length and percentage of the relevant intersections logged.</i></li> </ul>	<ul style="list-style-type: none"> <li>• All drill core has been qualitatively logged by company geologists, recording lithology, alteration, structures, rock quality and mineralization according to company procedures.</li> </ul>
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> <li>• <i>If core, whether cut or sawn and whether quarter, half or all core taken.</i></li> <li>• <i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i></li> <li>• <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i></li> <li>• <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i></li> <li>• <i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i></li> <li>• <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Drill core is cut with a rock saw and half core samples were submitted to ALS in Addis Ababa for sample preparation and analysis.</li> <li>• Samples were weighed up on receipt in the prep lab and crushed with a jaw crusher to 70% passing 2mm. The crushed material was split with a Jones-type riffle splitter to split off a 1000g subsample. The subsample was then pulverized to to 85% passing 75 micrometers.</li> <li>• Analysis of half-core field duplicates has resulted in a coefficient of variation of 37% which is consistent with a highly variable, nuggety gold deposit. However, the size of samples taken from the diamond drilling at Segele may be too small given the coarse-gold nature of the mineralisation.</li> </ul>
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> <li>• <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i></li> <li>• <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i></li> <li>• <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i></li> </ul>	<ul style="list-style-type: none"> <li>• All gold assays are done by certified laboratories using proven techniques that are commonly used through out the gold exploration and mining business.</li> <li>• Diamond drill samples were prepared at ALS (Addis Ababa) and then sent to ALS (Loughrea) and analysed. Samples submitted prior to September 2020 were analysed using a 30 g fire assay for samples not containing visible gold or a screen fire assay for samples that did contain visible gold. Some of the 30 g fire assays were subsequently re-assayed using a 50 g fire assay. From September 2020 onwards samples not containing visible gold were analysed using a 50 g fire assay.</li> <li>• QA/QC sampling: <ul style="list-style-type: none"> <li>- Diamond drilling – blanks at a rate of 2:25, CRM's at a rate of 1:10, field duplicates at a rate of 1:30, crush duplicates at a rate of 1:20 and pulp duplicates at a rate of 1:15.</li> </ul> </li> <li>• The analysis of error and bias from the available QC data has resulted in</li> </ul>

Criteria	JORC Code explanation	Commentary
		acceptable results. All previous unacceptable QC results have been investigated and resolved (see Mineral Resource Report 6 <sup>th</sup> April 2021).
Verification of sampling and assaying	<ul style="list-style-type: none"> <li>• <i>The verification of significant intersections by either independent or alternative company personnel.</i></li> <li>• <i>The use of twinned holes.</i></li> <li>• <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i></li> <li>• <i>Discuss any adjustment to assay data.</i></li> </ul>	<ul style="list-style-type: none"> <li>• There are no twin drill holes completed at Segele.</li> <li>• The company has implemented a cloud-based data management system (MX Deposit) which minimises transcription errors and allows transparent and accurate data collection.</li> <li>• No adjustments to assay data have been made</li> <li>• The competent person has verified the database against certificates of assay.</li> </ul>
Location of data points	<ul style="list-style-type: none"> <li>• <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i></li> <li>• <i>Specification of the grid system used.</i></li> <li>• <i>Quality and adequacy of topographic control.</i></li> </ul>	<ul style="list-style-type: none"> <li>• All drill hole collars are surveyed with a Leica total station survey tool.</li> <li>• For the first 41 drillholes downhole surveys were conducted using a DeviCore BBT tool which oriented the core and recorded changes in the drill hole dip at irregular intervals. The DeviCore tool does not record changes in azimuth and the drill holes are assumed to be straight.</li> <li>• All work has been carried out using WGS 84 UTM Zone 36N coordinate system.</li> </ul>
Data spacing and distribution	<ul style="list-style-type: none"> <li>• <i>Data spacing for reporting of Exploration Results.</i></li> <li>• <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i></li> <li>• <i>Whether sample compositing has been applied.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Diamond drilling at Segele was completed on a nominal drill spacing of between 10–15 mE by 10–15 mN. The diamond drilling spacing is sufficient to establish the geological and grade continuity of the Segele deposit for Mineral Resource estimation.</li> <li>• Assay intervals are nominally 1m but occasional shorter intervals occur.</li> </ul>
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> <li>• <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i></li> <li>• <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Diamond drilling at the Segele deposit has been conducted approximately perpendicular to the trend of the mineralisation. It does not appear that the orientation of the drilling has resulted in a sampling bias.</li> </ul>
Sample security	<ul style="list-style-type: none"> <li>• <i>The measures taken to ensure sample security.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Diamond drill hole samples are sealed and labelled inside of individual plastic bags and then 10 samples are put in bulka bags and sealed.</li> <li>• All sampling intervals are recorded onto paper logs and then entered into the Akobo geological database. ALS laboratory electronic submission forms are then completed for each sample batch and re-checked against the geological database entries.</li> </ul>

Criteria	JORC Code explanation	Commentary
		<ul style="list-style-type: none"> <li>• Samples are then transported by road to the ALS laboratory in Addis Ababa using a company truck. ALS perform a sample reconciliation when the samples are received.</li> <li>• Sample pulps are then exported to Ireland for analysis at the ALS laboratory in Loughrea and a pulp split is sent back to Akobo for storage.</li> <li>• Assay results are returned digitally and by hard-copy forms, and are checked against the sampling interval recorded in the geological database.</li> </ul>
<i>Audits or reviews</i>	<ul style="list-style-type: none"> <li>• <i>The results of any audits or reviews of sampling techniques and data.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Review of company procedures has taken place as a part of the resource estimation process.</li> </ul>

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<ul style="list-style-type: none"> <li>• <i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i></li> <li>• <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i></li> </ul>	<ul style="list-style-type: none"> <li>• The Segele deposit lies within Mineral Exploration Licence (MOM/EL/262/2002) which was renewed on 30 October 2020. The licence is renewed yearly, for up to 3 years duration after which time a mining licence is required for continued operation.</li> <li>• There are no known issues relating to third parties, however standard Ethiopian gold sales royalties will apply.</li> </ul>
<i>Exploration done by other parties</i>	<ul style="list-style-type: none"> <li>• <i>Acknowledgment and appraisal of exploration by other parties.</i></li> </ul>	<ul style="list-style-type: none"> <li>• All exploration work has been carried out by ETNO Mining Plc (ETNO) which is 99.97% owned by Akobo Mineral AB.</li> </ul>
<i>Geology</i>	<ul style="list-style-type: none"> <li>• <i>Deposit type, geological setting and style of mineralisation.</i></li> </ul>	<ul style="list-style-type: none"> <li>• The Segele deposit is a high-grade orogenic gold deposit hosted within altered ultramafic and mafic rocks. The mineralisation is controlled by northwest–southeast shear movement which has created local dilatational zones oriented in an east–west direction which favoured precipitation of gold in narrow zones and pockets of intense shearing within the ultramafic and overlying mafic units. Gold appears to have been introduced during hydrothermal alteration of the mafic to ultramafic rocks, where the minerals were altered to amphibole by hydrous solutions carrying gold. The host rocks(s) acted as traps, fixing and concentrating gold.</li> </ul>

Criteria	JORC Code explanation	Commentary																																																																																																																																																																																													
		<ul style="list-style-type: none"> <li>The mineralisation has been modelled as a series of compact thin and sometimes bifurcating lenses using a cut-off 0.10–0.15 g/t Au. The lenses occurred mostly within the ultramafic units but do also extend upwards into the overlying mafic units.</li> </ul>																																																																																																																																																																																													
Drill hole Information	<ul style="list-style-type: none"> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> <li>easting and northing of the drill hole collar</li> <li>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>dip and azimuth of the hole</li> <li>down hole length and interception depth</li> <li>hole length.</li> </ul> </li> <li>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>	<table border="1"> <thead> <tr> <th>Hole_ID</th> <th>East_UTM36</th> <th>North_UTM36</th> <th>RI</th> <th>Hole_depth</th> <th>Dip</th> <th>Azimuth</th> </tr> </thead> <tbody>
